

HugMe

Engineering design | Interaction design

Project brief:

This project combines an app and a device design to manage binge eating by providing distraction, group support, motivation, and monitoring food-related behavior, while the device tracks binge eating and transmits care.

2024.9 - 2024.10 Individual project

RESEARCH

Inspiration

I've personally struggled with binge eating disorder in the past, and one time, while watching a documentary on bulimia nervosa, I was reminded of the painful experiences I went through. That moment made me realize how much I want to help others facing these challenges, as I truly understand what they are experiencing.

are lost yearly because of eating disorders.

Rates of eating disorders in males are increasing

at a faster rate than those in females.

Understanding Bingeing

Why dieting?

Patients often set strict rules regarding the types of food, quantity, and meal times

It is also a form of emotional eating. In a study, 47.7% of binge eating was attributed by the participants to emotional states, particularly anxiety related to body image and appearance. Anger is the primary emotion. [2]

Patients follow strict dieting while their bodies crave food. A trigger event causes a counter regulation, leading to binge eating. Afterward,

BN and BED

patients do not purge.

Bulimia Nervosa (BN) patient use purging behaviors like vomiting to compensate

These eating disorders are common, dangerous, and difficult to control. When patients become aware of the problem, they seek help from the outside world. So, how effective is this help?

Available help

When facing an eating disorder, patients can seek help through two options.

Professional methods

But these seem to offer little help.

BRAINSTORM

I found that existing solutions have not paid attention to the binge phase, so I plan to focus on this point and two key features in the next step.

Ideas

Based on previous research and key points that need to be addressed, I brainstormed some ideas.

Although the previous 'counter-regulation' and emotional states can help me recognize trigger events to predict binge eating, with the current restrain, i don't have good solutions yet.

So I decided to deprioritize this problem and chose to combine the app with a wearable device, applying these functions to help patients manage binge eating impulses.
